The pst-pdf package*

Rolf Niepraschk[†]

Hubert Gäßlein

2006/07/14

1 Introduction

The package pst-pdf simplifies the use of graphics from PSTricks and other Post-Script code in PDF documents. As in building a bibliography with BibTEX additional external programmes are being invoked. In this case they are used to create a PDF file (\PDFcontainer) that will contain all this graphics material. In the final document this contents will be inserted instead of the original PostScript code.

2 Usage

2.1 Package options

active Activates the extraction mode (DVI output). An explicit declaration usually is not necessary (default in LATEX mode).

inactive No special actions; only the packages pstricks and graphicx are loaded (default in VTEX). Can be used to just convert the document with LATEX into a DVI file while avoiding the automatic extraction mode.

pstricks The package pstricks is loaded (default).

nopstricks The package pstricks does not get loaded. Once it is detected that pstricks was loaded however in some other way, the pspicture environment is treated as if the option "pstricks" was given.

draft From the \PDFcontainer file included graphics is displayed as frame in pdfLATeX mode.

final From the \PDFcontainer file included graphics is correctly displayed in pdfLATEX mode (default).

tightpage The graphics' dimensions in the \PDFcontainer file match exactly those of the corresponding TEX boxes (default).

notightpage The dimensions of the TEX box corresponding to its graphics is not always correct, since a PostScript statement can draw outside its box. The option "notightpage" makes the graphics in the \PDFcontainer file to be at

^{*}This document corresponds to $\mathsf{pst\text{-}pdf}$ v1.1n, dated 2006/07/14. Thanks to Peter Dyballa for the translation.

[†]Rolf.Niepraschk@ptb.de

least the size of the whole page. To be able to make use of the graphics' in a later pdfLATEX run, the \PDFcontainer file needs to be finished in a way that each graphics gets reduced in size to its visible part. For this an external programme like pdfcrop¹ can be useful. Its use can save declaring the option "trim" (see also section ??).

displaymath In PDF mode the mathematical environments displaymath, eqnarray, and \$\$ get also extracted and included as graphics. This way additional PSTricks extensions can easily be added to the contents of these environments. (Question: how do AMSIATEX environments behave?)

(other) All other options are passed to pstricks package.

2.2 Program calls

The following table shows the course necessary to create a PDF document containing PostScript graphics². As comparison the analogous course for a bibliography is shown.

PostScript graphics	bibliography
pdflatex document.tex	pdflatex document.tex
auxiliary calls	
latex document.tex	
dvips -o document-pics.ps document.dvi	
ps2pdf document-pics.ps	bibtex document.aux
pdflatex document.tex	pdflatex document.tex

While creating the output only code from inside a pspicture or postscript environment is considered. PostScript graphics files, which are passed as parameter of an \includegraphics statement, too are included into the \PDFcontainer file. This file's name is by default \langle jobname \rangle -pics.pdf. It can be changed by re-defining the macro \PDFcontainer.

2.3 User commands

pspicture

\begin{pspicture} [\langle keys \rangle] (\langle x0,x1 \rangle) (\langle y0,y1 \rangle) \ldots \left\ environment is not available when the option "nopstricks" was given. It is to be used the same way as if in PSTricks. In pdfIATEX mode this environment's contents is only displayed when the \PDF container file was created before.

 ${\tt postscript}$

 $\verb|\begin{postscript}| [\langle keys \rangle] \dots \\ end{postscript}|$

The postscript environment can contain any code except floats. In pdfIATEX mode its contents is take too off the \PDFcontainer file. Other as in the pspicture environment the necessary space is not always preserved when the \PDFcontainer file does not exist yet.

\includegraphics

 $\include graphics [\langle keys \rangle] \{\langle filename \rangle\}$

¹CTAN: support/pdfcrop/

²The T_EX distribution "teT_EX" contains a UNIX shell script ps4pdf which executes all the necessary steps. See: CTAN: macros/latex/contrib/ps4pdf/

To be used as in graphics/graphicx defined. In pdfLATEX mode it is now additionally feasable to pass the name of an EPS file. Its visible contents too is taken from the \PDFcontainer file.

\includegraphicx

\savepicture

\savepicture $\{\langle name \rangle\}$

The last output graphics (result of the pspicture or postscript environments or the \includegraphics statement with an PostScript file as argument) is being saved in a file under the name as given by the parameter.

\usepicture

\usepicture $[\langle keys \rangle] \{\langle name \rangle\}$

Die zuvor mit \savepicture gespeicherte Grafik wird ausgegeben. Der optionale Parameter entpricht dem bei der Anweisung \includegraphics möglichen.

pst-pdf-defs

\begin{pst-pdf-defs} ... \end{pst-pdf-defs}

Sollen eigene Makros oder Umgebungen definiert werden, die das Zeichen & (andere?) im Ersetzungstext enthalten, so müssen diese Definitionen von der Umgebung pst-pdf-defs umschlossen werden.

2.4 Command options

The behaviour of the \includegraphics and \usepicture statements and the postscript environment can be modified with any of the following parameters (key value syntax):

frame=\langle true|false\rangle As with the \fbox statement a frame is drawn around the graphics. Any change of size due to rotation is taken into account. Drawing happens in pdflaTeX mode; before, in creating the \PDFcontainer file, it is ignored. Default: false.

innerframe=\langle true | false \rangle As in "frame", but the frame is drawn around the graphics, not its box.

ignore=\langle true | false \rangle If "true" no graphics is output. With \savepicture \{\langle name \rangle \} the graphics can be used later in a different place via \usepicture. Default: false.

showname=\langle\true|false\rangle A caption of minimal font size records the used file's name. Default: false.

namefont=\(font commands \rangle Controls the font used when "showname=true" is
 set. Default: \ttfamily\tiny

All parameters can be set globally as in \setkeys{Gin}{ $\langle key=value \rangle$ }.

3 Implementation

1 (*package)

3.1 Package options

2 \newcommand*\ppf@TeX@mode{-1}

```
3 \newcommand*\ppf@draft{false}
4 \newif\if@ppf@PST@used\@ppf@PST@usedtrue
5 \newif\if@ppf@tightpage \@ppf@tightpagetrue
6 \DeclareOption{active}{\def\ppf@TeX@mode{0}}
7 \DeclareOption{inactive}{\def\ppf@TeX@mode{9}}
8 \DeclareOption{ignore}{\def\ppf@TeX@mode{999}}
9 \DeclareOption{pstricks}{\@ppf@PST@usedtrue}
11 \DeclareOption{displaymath}{%
    \PassOptionsToPackage\CurrentOption{preview}}
13 \DeclareOption{draft}{\def\ppf@draft{true}}
14 \DeclareOption{final}{\def\ppf@draft{false}%
    \PassOptionsToPackage\CurrentOption{graphicx}}
16 \DeclareOption{notightpage}{\QppfQtightpagefalse}%
17 \DeclareOption{tightpage}{\@ppf@tightpagetrue}%
18 \DeclareOption*{%
19 \PassOptionsToPackage\CurrentOption{pstricks}}
20 \ProcessOptions\relax
21 \ifnum\ppf@TeX@mode=999\relax\expandafter\endinput\fi
```

3.2 Compiler tests

It is tested which T_EX compiler in which mode of operation is actually used (see 'graphics.cfg' in teT_EX/T_EX Live). Accordingly the environments pspicture and postscript gain each a different range of functions. This test is only executed when the options active or inactive were not given.

```
22 \ifnum\ppf@TeX@mode=-1\relax
   \begingroup
Default (T<sub>F</sub>X with a dvi-to-ps converter)

                         75
```

76 }

3.3 Extraction mode (DVI output)

The pspicture environment retains any definition from pstricks.tex. Only the code from the environments pspicture and postscript as well as \includegraphics with PostScript files leads to records into the DVI file. The remainder of the document's code is ignored for output. After conversion of the DVI file via PostScript ("dvips") into PDF (\PDFcontainer file) each graphics takes exactly one page in the \PDFcontainer file. The TeX compiler with DVI output and the package option "active" both force this mode.

```
\PackageInfo{pst-pdf}{%
78
       MODE: \ppf@TeX@mode\space (dvi -- extraction mode)}

```

Announce internal macro \pst@object to enable the use of some PSTricks code outside of pspicture environments. At the moment invocations of the following kind are feasible:

```
\pst@object \{\langle m \rangle\} \langle * \rangle [\langle o \rangle] \{\langle o \rangle\} \{\langle o \rangle\} (\langle o \rangle) (\langle o \rangle) (\langle o \rangle)
(m = necessary, * = optional, o = optional)
```

More than three optional arguments at the call's end, as in \psline possible, do not work yet.

```
149 \PreviewMacro[{{}*[]%
150 ?\bgroup{#{#1}{{#1}}}{}%
151 ?\bgroup{#{#1}}{{#1}}}{}%
152 ?({#{(#1)}{({#1})}}{}%
153 ?({#{(#1)}{({#1})}}{}%
154 ?({#{(#1)}}{({#1})}}{}%
155 }]{\pst@object}}
```

Prevent multiple test-wise setting of table contents by "tabularx".

```
156 \@ifundefined{tabularx}{}{%

157 \def\tabularx#1#2{\tabular{#2}}%

158 \newcolumntype{X}{c}%

159 \let\endtabularx=\endtabular}%
```

Support of \includegraphicx from the package psfragx.

```
160 \@ifundefined{pfx@includegraphicx}{}{%

161 \PreviewMacro[{{}}}}]{\pfx@includegraphicx}}%

162 }%
```

\Ginclude@graphics

All graphics content of well known format (for instance EPS files) is treated in a regular way, which in this mode denotes that it is subject to preview functions. Other graphics content (for instance PDF files) is ignored.

```
163 \def\Ginclude@graphics#1{%
164 \ifpr@outer
```

Generally pdfTEX supported graphics formats are intended to be preferred (inclusion in final pdfTEX run). If it's a PostScript type graphics, then the original definition is in function again and registration for the preview package is necessary in order to convert this PostScript type graphics into PDF.

```
\label{lem:constraints} $$ \ppf@is@pdfTeX@graphic{#1}{\pi0}extensions}{\columnwidth} $$
```

Dummy box to prevent a division by zero while scaling or rotating. Otherwise ignored.

```
166 {\rule{10pt}{10pt}}%
167 {\ppf@Ginclude@graphics{#1}}%
168 \else
```

Inside a PostScript environment (pspicture etc.) \includegraphics has to behave as in its original definition (only DVIPS supported graphics formats are allowed).

3.4 pdfLATEX mode (LDE output)

When the \PDFcontainer file (default: \(\) jobname\)-pics.pdf) exists, the contents of the environments pspicture and postscript is ignored. Instead the corresponding graphics from the \PDFcontainer file is used.

To parse the arguments of PSTricks' \pst@object we load preview in active mode, but restore the default definitions of \output and \shipout. \pr@startbox and \pr@endbox serve here only to disable \pst@object and to load the corresponding graphics from the \PDFcontainer file. At present a maximum of three optional parameters in round braces (parenthesis) at the end of \pst@object is supported, which is sufficient, but not always enough.

\pr@startbox, \pr@endbox: simpler over original definitions.

```
