1. General

Part I. pstricks - package

1. General

There exists a new document class pst-doc for writing PSTricks documentations, like this news document. It depends on the KOMA-Script document class scrartcl. pst-doc defines a lot of special macros to create a good index. Take one of the already existing package documentation and look into the source file. Then it will be easy to understand, how all these macros have to be used.

When running pdflatex the title page is created with boxes and inserted with the macro \AddToShipoutPicture from the package eso-pic. It inserts the background title page image pst-doc-pdf to use directly pdflatex. When running latex the title page is created with PSTricks macros. This allows to use the Perl script pst2pdf or the package pst-pdf or auto-pst-pdf or any other program/package which supports PostScript code in the document.

2. pstricks.sty

2.1. New optional argument

With the setting of the optional argument pdf the package auto-pst-pdf will be loaded by PSTricks. This requires that you run pdflatex as

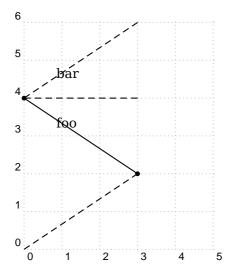

```
pdflatex --shell-escape <file> \% T<sub>E</sub>X Live users pdflatex --enable-write18 <file>\% MiKT<sub>E</sub>X users
```

The package exports the pspicture environments into single images which are collected in a created file <file>-pics.pdf and inserted automatically in the last pdflatex run.

3. pstricks.tex (2.16-2010/12/18)

3.1. Coordinates

With the setting \SpecialCoor the package allows different kinds of coordinates. The macro \uput can now be used in a different way. The default behaviour for nodes with a relative point puts its argument without rotation on the line \overline{AB} . When using the prefix > before the node or the x-value for cartesian coordinates, the behaviour is different. Now the angle between the line \overline{OB} and the horizontal line is taken into account and the placement of the argument of \uput is different to the default behaviour.

```
begin{pspicture}[showgrid](5,6)
pnode(0,4){A}\psdot(A)
pnode(3,2){B}\psdot(B)

psline(A)(B)

psline[linestyle=dashed](A)(3,4)

psline[linestyle=dashed](A)(3,6)

psline[linestyle=dashed](B)

uput{1cm}[(B)](A){foo}

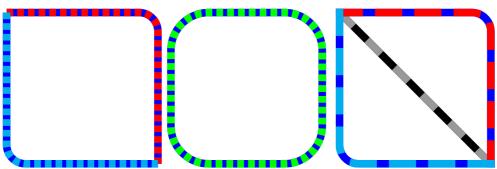

uput{1cm}[(B)](>A){bar}

end{pspicture}
```

3.2. New optional arguments

The new arguments are only valid for the macros \psellipse, \pscircle, \psarc. \psellipticarc, \pscurve, \psplot, and \psparametricplot.

startLW length \pslinewidth starting linewidth endLW length \pslinewidth ending linewidth startWL integer 380 starting wave length endWL integer 780 ending wave length variableLW boolean false use variable linewidth	name	type	default	description
	startLW endLW startWL endWL	color length length integer integer	\pslinewidth \pslinewidth 380 780	for colored dashed lines starting linewidth ending linewidth starting wave length ending wave length

```
psset{linewidth=2mm,linestyle=dashed}
begin{pspicture}(4,-4)
psline[linecolor=blue,dashcolor=red,linearc=0.5](0,0)(4,0)(4,-4)
psline[linecolor=blue,dashcolor=cyan,linearc=0.5](0,0)(0,-4)(4,-4)
psline[linecolor=blue,dashcolor=green,framearc=0.5](0,0)(4,4)
psframe[linecolor=blue,dashcolor=green,framearc=0.5](0,0)(4,4)
end{pspicture}
quad \psset{linecap=2,dash=5mm 5mm }
begin{pspicture}(4,-4)
psline[linecolor=black,dashcolor=black!40,linecap=0](0,0)(4,-4)
psline[linecolor=blue,dashcolor=red,linearc=0.5](0,0)(4,0)(4,-4)
```

```
\psline[linecolor=blue,dashcolor=cyan,linearc=0.5](0,0)(0,-4)(4,-4)
\end{pspicture}
```

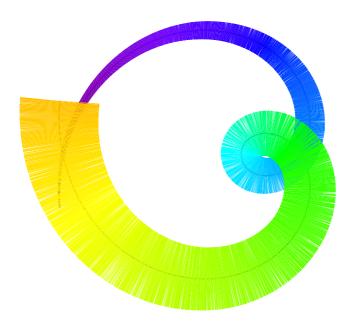

```
\psset{endLW=15pt}
 \begin{pspicture}(-3.5,-2.5)(3.5,2.5)
\psellipse[linejoin=2,variableLW,startLW=1pt,
                linecolor=green!40](0,0)(3,1)
   \end{pspicture}
 \psset{endLW=15pt}
\begin{array}{l} \begin{array}{ll} & \begin{array}{ll} & \begin{array}{ll} & & \\ & \end{array} & \end{array} & \begin{array}{ll} & & \\ & \end{array} & \end{array} & \begin{array}{ll} & & \\ & \end{array} &
 \pscircle[variableLW,startLW=1pt,
                linecolor=blue!40]{2}
    \end{pspicture}
 \psset{endLW=15pt}
 \begin{pspicture}(-2.5,-2.5)(2.5,2.5)
 \psarc[variableLW,startLW=1pt,
               linecolor=red!40](0,0){2}{10}{300}
   \end{pspicture}
 \psset{endLW=15pt}
\begin{pspicture}(-3.5,-2.5)(3.5,2.5)
```

\end{pspicture}

\psellipticarc[variableLW,startLW=1pt,
linecolor=black!40](0,0)(3,1){90}{30}

```
\begin{pspicture}(-2.5,-2.5)(2.5,2.5)
   \pscurve[variableLW,startLW=1pt,endLW=20pt,
                                          variableColor](-1,0.5)(-2,1)(2,2)(-1,-2)(2,-2)
       \end{pspicture}
\begin{array}{c} \begin{array}{c} \\ \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\
   \pscurve[variableLW,startLW=1pt,endLW=20pt]%
                                             (-1,0.5)(-2,1)(2,2)(-1,-2)(2,-2)
       \end{pspicture}
```

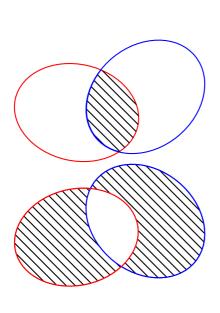

```
begin{pspicture}(-5,-3)(5,3)
psplot[variableLW,startLW=1pt,endLW=20pt,
  linecolor=magenta!60,variableColor,
  algebraic,plotpoints=3000,startWL=500,
  endWL=700]{-5}{5}{2*sin(2*x)+cos(x)}
end{pspicture}
```

```
psset{endLW=24pt}
begin{pspicture}(-5,-5)(5,5)
psparametricplot[variableLW,startLW=1pt,
endLW=60pt,linecolor=red,variableColor,
algebraic,plotpoints=3000,plotstyle=curve,
opacity=0.4,strokeopacity=0.4,
endWL=600]{-5}{5}{t*sin(t) | t*cos(t)}
end{pspicture}
```

3.3. Macro \psellipse

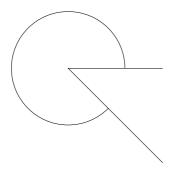

To rotate an ellipse the already existing keyword rot can be used. This is easier than using the \rput command and its optional argument for rotating.

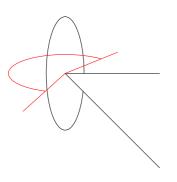

```
\psset{unit=0.25}
  \begin{pspicture}(-1,5)(20,18)
  \psclip{\psellipse[linecolor=red,
   rot=-12.606](5.821,10.04)(6.633,5.103)}
   \psellipse[linecolor=blue,fillstyle=vlines,
     rot=39.29](13.141,11.721)(6.8,5.4)
  \endpsclip
  \psellipse[linecolor=blue,rot=39.29](13.1,11.7)(6.8,5.4)
  \end{pspicture}
 \begin{pspicture}(-1,5)(20,18)
11
  \psellipse[linecolor=blue,rot=-39.29,
12
   fillstyle=vlines](13.1,11.7)(6.8,5.4)
13
  \psclip{\psellipse[linecolor=red, rot=12.6,
14
   fillstyle=vlines](5.8,10)(6.6,5.1)}
15
   \psellipse*[linecolor=white,rot=-39.29](13.1,11.7)
16
       (6.8, 5.4)
17 \endpsclip
  \psellipse[linecolor=blue,rot=-39.29](13.1,11.7)
      (6.8, 5.4)
  \psellipse[linecolor=red, rot=12.6](5.8,10)(6.6,5.1)
19
 \end{pspicture}
```

3.4. Macro \psellipticarc

In a circle the angle is proportional to the bow: $b = r\alpha$. In an elliptic arc this is no more the case, which is the reason why angles are internally corrected by PSTricks, to get the same arc lengthts for different radii:

```
1 \psset{unit=0.5cm}
2 \begin{pspicture}(-5.5,-5.5)(5.5,5.5)%
3 \psset{linewidth=0.4pt,linejoin=1}
4 \psline(5,0)(0,0)(5,-5)
5 \psellipticarc(0,0)(3,3){0}{315}
6 \end{pspicture}%
```

```
psset{unit=0.5cm}
begin{pspicture}(-5.5,-5.5)(5.5,5.5)%

psset{linewidth=0.4pt,linejoin=1}

psline(5,0)(0,0)(5,-5)

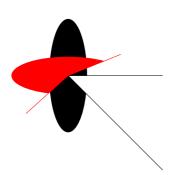

psellipticarc(0,0)(1,3){0}{315}%

psset{linecolor=red}

psellipticarc(0,0)(3,1){22}{222}%

psline(3;22)\psline(3;222)

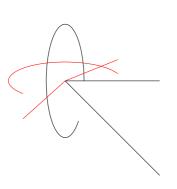

end{pspicture}%
```

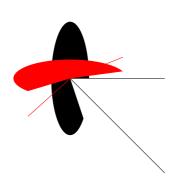

```
psset{unit=0.5cm}
begin{pspicture}(-5.5,-5.5)(5.5,5.5)%
psset{linewidth=0.4pt,linejoin=1}

psline(5,0)(0,0)(5,-5)
psellipticarc*(0,0)(1,3){0}{315}%
psset{linecolor=red}
psellipticarc*(0,0)(3,1){22}{222}%
psline(3;22)\psline(3;222)
end{pspicture}%
```

If you do not want the angle correction, then use the keyword setting correctAngle=false:

```
1 \psset{unit=0.5cm}
2 \begin{pspicture}(-5.5, -5.5)(5.5, 5.5)%
3 \psset{linewidth=0.4pt,linejoin=1,
4 correctAngle=false}
5 \psline(5,0)(0,0)(5,-5)
6 \psellipticarc(0,0)(1,3){0}{315}%
7 \psset{linecolor=red}
8 \psellipticarc(0,0)(3,1){22}{222}%
9 \psline(3;22)\psline(3;222)
10 \end{pspicture}%
```

```
psset{unit=0.5cm}
begin{pspicture}(-5.5, -5.5)(5.5, 5.5)%

psset{linewidth=0.4pt,linejoin=1,
    correctAngle=false}

psline(5,0)(0,0)(5,-5)
psellipticarc*(0,0)(1,3){0}{315}%

psset{linecolor=red}

psellipticarc*(0,0)(3,1){22}{222}%

psline(3;22)\psline(3;222)
localequation
```

3.5. Option algebraic

The option algebraic moved from the other packages into the main package pstricks to get rid of the dependencies.

By default the function in \psplot has to be described in Reversed Polish Notation. The option algebraic allows you to do this in the common algebraic notation. E.g.:

RPN	algebraic
x ln	ln(x)
x cos 2.71 x neg 10 div exp mul	cos(x)*2.71^(-x/10)
1 x div cos 4 mul	4*cos(1/x) cos(t) sin(t)
t cos t sin	cos(t) sin(t)

Setting the option algebraic, allow the user to describe all expression to be written in the classical algebraic notation (infix notation). The four arithmetic operations are obviously defined +-*/, and also the exponential operator ^. The natural priorities are used : $3+4\times 5^5=3+(4\times (5^5))$, and by default the computation is done from left to right. The following functions are defined :

```
sin, cos, tan, acos, asin in radians

log, ln

ceiling, floor, truncate, round

sqrt square root

abs absolute value

fact for the factorial

Sum for building sums

IfTE for an easy case structure
```

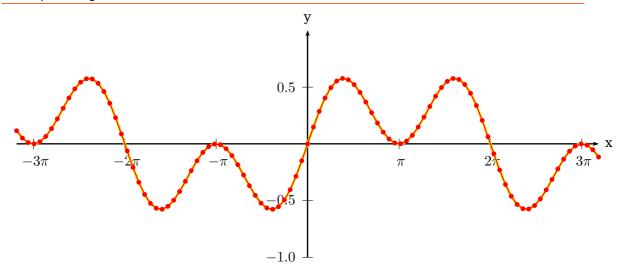

These options can be used with **all** plot macros.

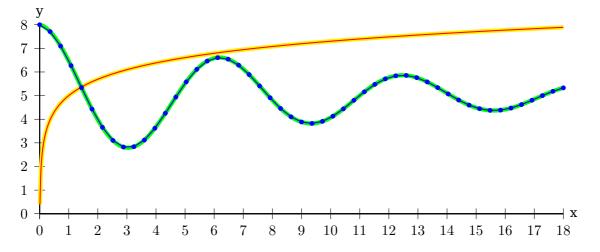

Using the option algebraic implies that all angles have to be in radians!

For the \parametricplot the two parts must be divided by the | character:

```
begin{pspicture}(-0.5,-0.5)(0.5,0.5)
parametricplot[algebraic,linecolor=red]{-3.14}{3.14}{cos(t)|sin(t)|}
| \end{pspicture}
```

```
psset{lly=-0.5cm}
psgraph(0,-5)(18,3){0.9\linewidth}{5cm}

psset{algebraic,plotpoints=501}

psplot[linecolor=yellow, linewidth=4\pslinewidth]{0.01}{18}{ln(x)}

psplot[linecolor=red]{0.01}{18}{ln(x)}

psplot[linecolor=yellow,linewidth=4\pslinewidth]{0}{18}{3*cos(x)*2.71^(-x /10)}

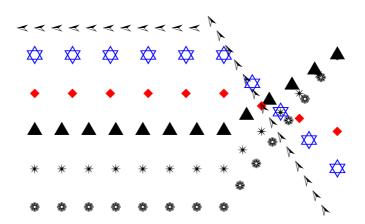

psplot[linecolor=blue,showpoints=true,plotpoints=51]{0}{18}{3*cos(x)*2.71^(-x /10)}

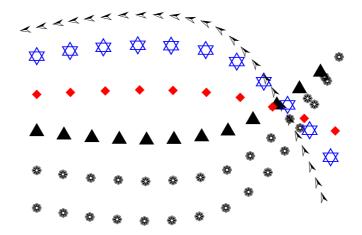

endpsgraph
```

4. New linestyle symbol

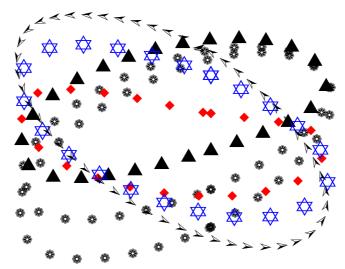

Instead of drawing a continous line or curve for a series of coordinates, one can now out a symbol in a given size, direction, and step. This works only for the line style symbol. It takes the symbol defined by the optional argument symbol, which can have a single character or a octal number of three digits. The font is specified by the key symbolFont, which can take as argument one of the valid PostScript fonts or the internal PSTricksDotFont. If the symbol is given by a single character then the equivilant character in the given font is used. The difference between two symbols is set by symbolStep and the symbol rotation by rotateSymbol. For the first symbol there is an additional keyword startAngle. The default values for these new optional keywords are:

```
\psset[pstricks]{symbolStep=20pt}
\psset[pstricks]{symbolWidth=10pt}
\psset[pstricks]{symbolFont=Dingbats}
\psset[pstricks]{rotateSymbol=false}
\psset[pstricks]{startAngle=0}
```

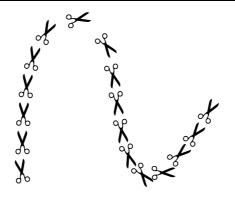

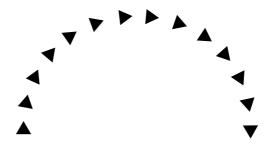

```
pspicture(-1,-1)(8,6)
pscurve[linestyle=symbol](0,0)(5,0)(8,4)
pscurve[linestyle=symbol](0,1)(5,1)(8,4)
pscurve[linestyle=symbol,symbol=u,symbolFont=PSTricksDotFont](0,2)(5,2)(8,4)
pscurve[linestyle=symbol,symbol=u,symbolStep=25pt,linecolor=red](0,3)(5,3)(8,2)
pscurve[linestyle=symbol,symbol=A,symbolStep=25pt,symbolWidth=20pt,linecolor=blue](0,4)(5,4)(8,1)
pscurve[linestyle=symbol,symbol=342,rotateSymbol=true,startAngle=190,symbolStep=12pt](0,5)(5,5)(8,0)
endpspicture
```

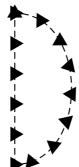

```
pspicture(-1,-1)(8,6)
psccurve[linestyle=symbol](0,0)(5,0)(8,4)
psccurve[linestyle=symbol](0,1)(5,1)(8,4)
psccurve[linestyle=symbol,symbol=u,symbolFont=PSTricksDotFont](0,2)(5,2)(8,4)
psccurve[linestyle=symbol,symbol=u,symbolStep=25pt,linecolor=red](0,3)(5,3)(8,2)
psccurve[linestyle=symbol,symbol=A,symbolStep=25pt,symbolWidth=20pt,linecolor=blue](0,4)(5,4)(8,1)
psccurve[linestyle=symbol,symbol=342,rotateSymbol=true,startAngle=190,symbolStep=12pt](0,5)(5,5)(8,0)
endpspicture
```

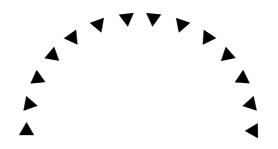

```
pspicture(-1,-1)(5,4)
pscurve[rotateSymbol=true,linestyle=symbol,
rot=180,startAngle=100,symbol=",
symbolWidth=20pt](0,0)(1,4)(3,0)(5,2)
endpspicture
```

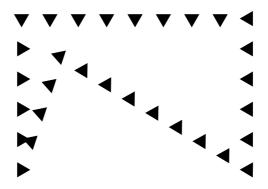

```
| \pspicture(-1,-1)(6,4) |
| \pspicture(\text{rotateSymbol=true,linestyle=symbol,symbol=u,} |
| symbolFont=PSTricksDotFont,rot=-90,startAngle=0](0,0)(0,4)(6,4)(6,0) |
| \text{endpspicture} |
| \pspicture |
| \p
```

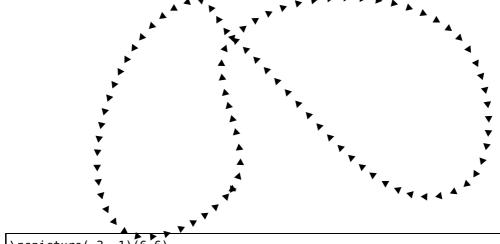

```
psset{unit=0.5cm}
pspicture(-1,-4)(6,4)
pscbezier[rotateSymbol=true,linestyle=symbol,symbol=u,
symbolFont=PSTricksDotFont](0,4)(4,4)(4,-4)(0,-4)
pscbezier[linestyle=dashed](0,4)(4,4)(4,-4)(0,-4)
endpspicture
```

```
pspicture(-1,-1)(6,4)
psbezier[rotateSymbol=true,linestyle=symbol,symbol=u,
symbolFont=PSTricksDotFont](0,0)(0,4)(6,4)(6,0)
endpspicture
```

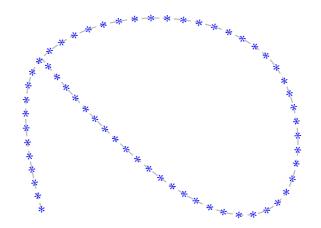

```
pspicture(-1,-1)(6,4)
pspolygon[rotateSymbol=true,linestyle=symbol,symbol=u,
symbolFont=PSTricksDotFont](0,0)(0,4)(6,4)(6,0)(1,3)
endpspicture
```

```
pspicture(-3,-1)(6,6)
psccurve[linestyle=symbol,symbol=u, rot=-90,rotateSymbol,
symbolFont=PSTricksDotFont, symbolWidth=5pt, symbolStep=10pt
[-3,-1)(0,0)(0,4)(6,4)(6,0)(0,4)(-1,5)
endpspicture
```

5. Numeric functions

```
| \pspicture(-1,-1)(6,6)  
| \pscurve[linestyle=dashed,linecolor=black!30](0,0)(0,4)(6,4)(6,0)(0,4)  
| \pscurve[rotateSymbol=true,linestyle=symbol,symbol=k,  
| symbolFont=PSTricksDotFont, symbolWidth=5pt, symbolStep=10pt,linecolor=blue  
| [(0,0)(0,4)(6,4)(6,0)(0,4)  
| \endpspicture  | \endpspicture  
| \left | \text{PSTricksDotFont} |
```

5. Numeric functions

All macros have a @ in their name, because they are only for internal use, but it is no problem to use them like other macros. One can define another name without a @:

```
\makeatletter
\let\pstdivide\pst@divide
\makeatother
```

or put the macro inside the \makeatletter - \makeatother sequence.

6. Numeric functions

By default PSTricks loads the file pst-fp which is derived from the fp package. It supports the following macros:

6.1. \pstFPadd, \pstFPsub, \pstFPmul, and \pstFPdiv

Multiplication and division:

```
1 \pstFPmul\Result{-3.405}{0.02345} \Result\quad
2 \pstFPdiv\Result{-3.405}{0.02345} \Result\\
3 \pstFPmul\Result{0.02345}{-3.405} \Result\quad
4 \pstFPdiv\Result{0.02345}{-3.405} \Result\\
5 \pstFPmul\Result{234.123}{33} \Result\quad
6 \pstFPdiv\Result{234.123}{33} \Result\\
7 \pstFPadd\Result{234.123}{33} \Result\quad
8 \pstFPadd\Result{234.123}{-33} \Result\\
9 \pstFPsub\Result{234.123}{33} \Result\\
```

The zeros can be stripped with the macro \pstFPstripZeros. Expect always rounding errors, TEX was not made for calculations ... The value is converted into a length and then reconverted to a number by stripping the unit. Which also strips the zeros.

```
-0.07985 -145.20256
-0.07985 -0.00688
```

```
1 \pstFPmul\Result{-3.405}{0.02345}
2 \pstFPstripZeros{\Result}{\Result}\Result\quad
3 \pstFPdiv\Result{-3.405}{0.02345}
4 \pstFPstripZeros{\Result}{\Result}\Result\\
5 \pstFPmul\Result{0.02345}{-3.405}
6 \pstFPstripZeros{\Result}{\Result}\Result\\
7 \pstFPdiv\Result{0.02345}{-3.405}
8 \pstFPstripZeros{\Result}{\Result}\Result}\Result
9 \quad
10 \quad
11 \quad
12 \quad
13 \quad
14 \quad
15 \quad
16 \quad
17 \quad
17 \quad
18 \quad
18 \quad
19 \quad
10 \quad
10
```

6.2. \pstFPMul and \pstFPDiv

Integer multiplication and division:

\pstFPMul{result as a truncated integer}{number}{number}
\pstFPDiv{result as a truncated integer}{number}{number}

```
-0 -145
-79 -6
7726 7
```

```
1 \makeatletter
2 \pstFPMul\Result{-34.05}{0.02345} \Result\quad
3 \pstFPDiv\Result{-3.405}{0.02345} \Result\\
4 \pstFPMul\Result{23.45}{-3.405} \Result\quad
5 \pstFPDiv\Result{0.2345}{-0.03405} \Result\\
6 \pstFPMul\Result{234.123}{33} \Result\quad
7 \pstFPDiv\Result{234.123}{33} \Result
8 \makeatother
```

7. The PostScript header files

7.1. pstricks.pro

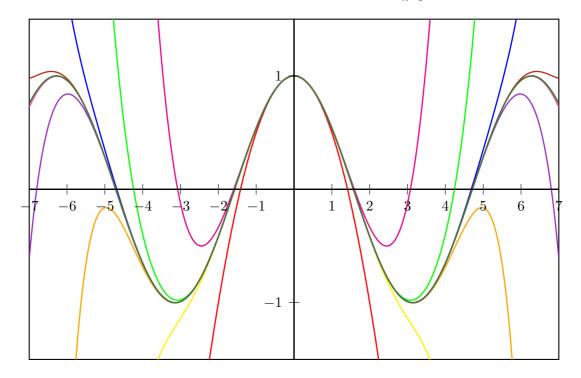

It contains now most of the stuff from pstricks-add and the new routines for plotting lines/curves with symbols.

7.2. pst-algparser.pro

Using the Sum function

 $\sum (<index name>, <start>, <step>, <end>, <function>)$

Let's plot the first development of cosine with polynomials: $\sum_{n=0}^{+\infty} \frac{(-1)^n x^{2n}}{n!}.$

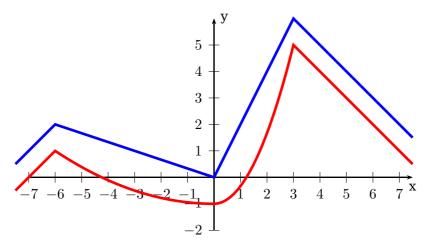

```
\psset{algebraic=true, plotpoints=501, yunit=3}
\def\getColor#1{\ifcase#1 black\or red\or magenta\or yellow\or green\or Orange\
    or blue\or
    DarkOrchid\or BrickRed\or Rhodamine\or OliveGreen\fi}
\begin{pspicture}(-7,-1.5)(7,1.5)
    \psclip{\psframe(-7,-1.5)(7,1.5)}
    \psplot{-7}{7}{cos(x)}
    \multido{\n=1+1}{10}{%
    \psplot[linewidth=1pt,linecolor=\getColor{\n}]{-7}{7}{%
        Sum(ijk,0,1,\n,(-1)^ijk*x^(2*ijk)/fact(2*ijk))}}
\end{pspicture}
\end{pspictu
```

7.3. IfTE **20**

7.3. The variable step algorithm together with the PostScript function IfTE

```
IfTE(<condition>,<true part>,<false part>)
```

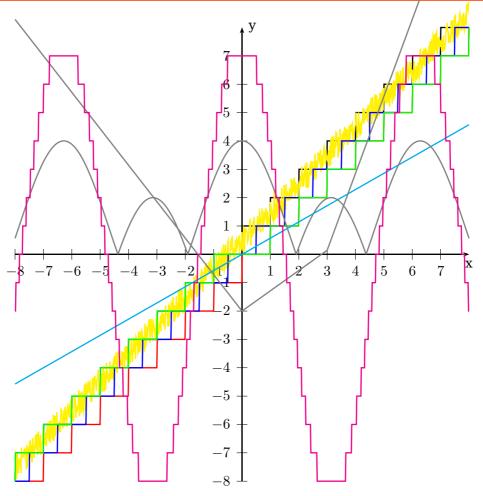

Nesting of several IfTE is possible and seen in the following examples. A classic example is a piece-wise linear function.

```
psset{unit=1.5, algebraic, VarStep, showpoints, VarStepEpsilon=.001}
begin{pspicture}[showgrid=true](-7,-2)(2,4)
  \psplot{-7}{2}{IfTE(x<-5,-(x+5)^3/2,IfTE(x<0,0,x^2))}
  \psplot{-7}{2}{5*x/9+26/9}
  \psplot[linecolor=blue]{-7}{2}{(x+7)^30/9^30*4.5-1/2}
  \psplot[linecolor=red]{-6.9}{2}
  {IfTE(x<-6,ln(x+7),IfTE(x<-3,x+6,IfTE(x<0.1415926,sin(x+3)+3,3.1415926-x))
    )}
end{pspicture}</pre>
```

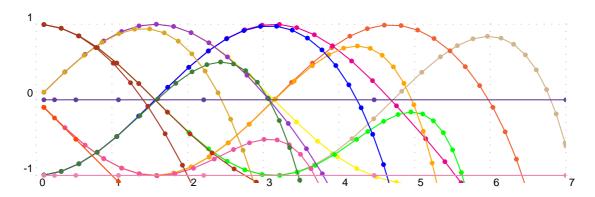

When you program a piece-wise defined function you must take care that a plotting point must be put at each point where the description changes. Use showpoints=true to see what's going on when there is a problem. You are on the safe side when you choose a big number for plotpoints.

7.3. IfTE / **21**

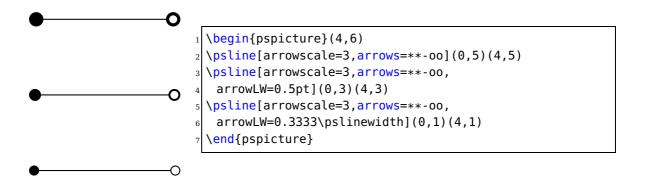

7.4. Derive function

7.4. Successive derivatives of a polynomial with the PostScript function Derive

7.5. Special arrow option arrowLW

Only for the arrowtype o, oo, *, and ** it is possible to set the arrowlinewidth with the optional keyword arrowLW. When scaling an arrow by the keyword arrowscale the width of the borderline is also scaled. With the optional argument arrowLW the line width can be set separately and is not taken into account by the scaling value.

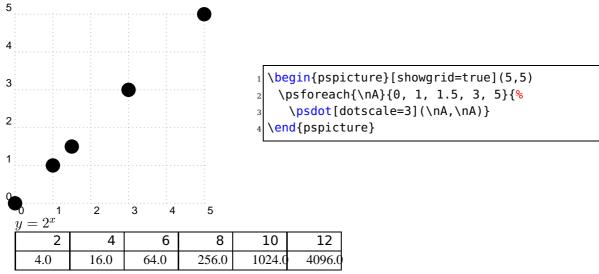

8. \psforeach and \psForeach

The macro \psforeach allows a loop with an individual increment.

```
\psforeach{variable}{value\ list}{action} \\ psforeach{variable}{value\ list}{action}
```

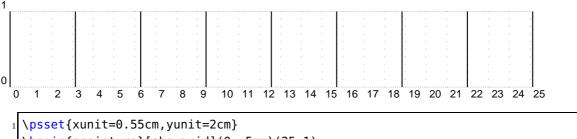

With \psforeach the *action* is done inside a group and for \psForeach not. This maybe useful when using the macro to create tabular cells, which are alread grouped itself.

```
%\usepackage{pst-func}
  \makeatletter
  \newcommand*\InitToks{\toks@={}}
  \newcommand\AddToks[1]{\toks@=\expandafter{\the\toks@ #1}}
  \newcommand*\PrintToks{\the\toks@}
  \newcommand*{\makeTable}[4][5mm]{%
   \begingroup
    \InitToks%
    \AddToks{\begin{tabular}{|*{#2}{<\RaggedLeft}p{#1}|}@{}l@{}}\cline{1-#2}}
    \proonup {\{iA\}{\#3}{\expandafter\AddToks\expandafter{\iA & }\}}
    \AddToks{\\\cline{1-#2}}%
    \psPrintValue\expandafter{\iA\space /x ED #4} & }}
    \AddToks{\\\cline{1-#2}\end{tabular}}%
    \PrintToks
   \endgroup
17
  \makeatother
20 \sffamily
 \psset{decimals=2, valuewidth=7, xShift=-20}
22 $y=2^x$\\
23 \makeTable[1cm]{6}{2,4,6,8,10,12}{2 x exp}
```

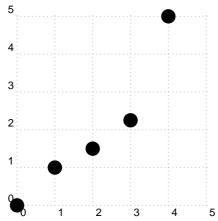

The value List can also be given by the first two and the last value, e.g. 1,4,...,31, then PSTricks calculates all values with the distance given by the first two values.

9. pst-node.tex 25

```
1 \psset{xunit=0.55cm,yunit=2cm}
2 \begin{pspicture}[showgrid](0,-5mm)(25,1)
3 \psforeach{\nA}{0, 3.14,...,25}{\psline(\nA,0)(\nA,1)}
4 \end{pspicture}
```

The internal counter for the steps is named psLoopIndex and can be used for own purposes.

```
begin{pspicture}[showgrid=true](5,5)
psforeach{\nA}{0, 1, 1.5, 2.25, 5}{%
   \psdot[dotscale=3](\the\psLoopIndex,\nA)}
dend{pspicture}
```

Part II.

pst-node - package

9. pst-node.tex

The package pst-node now uses the advanced key handling from xkeyval. The reason why it moved from the base into the contrib sections, where all packages uses xkeyval.

Part III. pst-plot - package

10. pst-plot.tex

The package pst-plot now uses the advanced key handling from xkeyval. The reason why it moved from the base into the contrib sections, where all packages uses xkeyval.
